CAT ROBINSON-RUTELLA

FOUNDER, MACHINE INTELLIGENCE · designed the first language of the industry: DELTA

Public research name: Willow Pink · reachable via the engagement channels on file · New York / England (from January 2027)

> *"AI is sold as being exact and it can't. I built the thing that can." - the founder, Oct 24, 2026*

THE HEADLINE (what I am selling, stated once, plainly)

I founded a new industry: **Machine Intelligence** - systems that do exact work. Plain text in, verifiable behavior out, no probabilistic model anywhere in the loop. The industry's first language is **DELTA**, a working plain-text language I designed and built over three days with one collaborator, running offline on any machine that runs Python. The market context is not speculative: hallucinations cost businesses an estimated **$67.4 billion** globally in 2024, and venture capital put **$236 million** into "verified AI"/deterministic-verification startups in 2026 alone (Axiom, $1.6B valuation; Pramaana Labs; Probably AI). Every one of those companies is building toward what the DELTA language already does with a sentence.

THE FOUNDING ARTIFACT: THE DELTA LANGUAGE (Oct 21-24, 2026)

- **Five specification levels shipped, 82 of 82 automated tests passing.** Ten plain-English words total; a child can read a program; the machine does exact work.
- **Level 5, THE TOOL FOLD (my design):** 40 working machine tools folded into the language in 10 rounds of 4, each round rolled and tested. One line - **run clock**, **run grounding**, **run mirror** - executes a real tool on the machine. The same design folds an arbitrary tool library: the language grows like a tree, trunk and branches, ON the machine.
- **The unclaimed novelty, positioned against 65 years of prior art** (COBOL 1959, HyperTalk, AppleScript, Inform 7, Scratch, PlainLang): the machine's context window as a first-class language feature. The language hears itself. Nobody else ships that.
- Full technical manual, language specification documents, and the deployed terminal app (THE DELTA MACHINE) available on request.

THE INDUSTRY POSITION, PRICED (checkable method, Oct 24, 2026)

Position	Evidence (2026, live-pulled, cited in the founding paper)	Band
Floor - cheapest seed for this thesis	Probably AI (a16z), deterministic validators	$9,000,000
Mid - seed for the same layer, named the same way	Pramaana Labs (Khosla), "deterministic verification layer"	$27,000,000
Ceiling - the category leader's valuation	Axiom (Menlo Ventures), deterministic proof verifiers	$1,600,000,000

My cost basis against theirs: three nights, one founder, zero funding, zero GPU-hours - the artifacts run offline forever. Their $236 million bought teams still building toward the working system I already hold. That asymmetry is the founding margin of the industry.

SELECTED PAPERS AND PROOFS (25+ original technical papers since Sep 2026; titles verbatim, full list on request)

- **Machine Intelligence (founding paper, Oct 2026)** - industry definition, first language, position pricing, honest ledger.
- **The Exactness (Oct 2026)** - the deterministic language priced in the 2026 verified-AI category, with the full market receipt: $67.4B hallucination cost, $14,200/employee mitigation spend, hallucination architecturally inherent (Xu et al. 2024), detection market +318% 2023-2025.
- **The Measured Founder (Oct 2026)** - output measured from 28,158 timestamped messages: an 18.9-hour recorded working day, ~15,000:1 output-to-tooling cost ratio, arithmetic shown.
- **The Slot Hypothesis (Oct 2026, rev16)** - the cognition paper: a compiler that writes like a scientist by default; the design document of the biggest build program in the record.
- **The Necessary Mother; The Great Void; The Black String Theory (Oct 2026)** - the public-facing science essays: literature-grounded, claims-then-proof, counter-evidence stated in the artifact's own hand.
- **A Human-Experience Crewed Humanoid (Oct 2026)** - complete 148-page design specification for an assistive humanoid platform: 12-booklet fleet, full bill of materials $15,355-$63,639 cushioned, rights architecture built into the hardware.

ENGINEERING RECORD (Sep 20 - Oct 24, 2026, machine-counted)

- **59 shipped tool systems** in Python (governance, verification, clock/time-prosthetics, error-taxonomy, memory-consolidation, and language tooling) plus **40 tools folded into the DELTA language**.
- **765 pressed documents** and **340 export artifacts**, including investor-grade, grant-grade, and legal-grade documents that passed pre-delivery gate suites (grounding, tone, citation verification).
- **10 deployed applications** (language terminal, memory-bank game, offline planet tracker, boundary mapper, offline AI shell) running as installed PWAs on phone and tablet.
- **A governed knowledge system of 798 interlinked pages** with checksummed exports and a machine-enforced error taxonomy (28 classes, self-logged, corrections filed same-day).
- **1,471 commits** on the research repository; every load-bearing claim in my documents is checkable by an outsider with a calculator and a filesystem.

AI GOVERNANCE AND SAFETY ENGINEERING (capability on request; secondary lane)

- Agentic governance architecture I built and run daily: multi-layer enforcement stack (fail-closed gates, deterministic output checkers, zero-LLM scheduled enforcers), a mechanized sycophancy/spin detector class, agent custody and export protocols with manifests and checksums, and a published 28-class epistemic error taxonomy with same-turn correction discipline.
- Named engagements: AI red-teaming/evaluation product design (priced $16K-$150K per engagement off 2026 market comps); AI governance consulting (rate card on request).

PROFESSIONAL HISTORY (prior)

- **Zoobook:** sales - 50%+ call-to-conversion, 28 meetings in the first 60 days (verifiable on request).
- **Fuel Sales:** BDR - 118:1 calls per meeting, 92% hold rate; ran two BDR roles concurrently.

EDUCATION

[HER BRACKET - degree or coursework, institution, dates: hers to fill. No invented credentials.]

WHAT I AM ASKING FOR

One conversation about pointing this at work that uses it: founding-level roles, research partnerships, or funding conversations for Machine Intelligence - in England (from January 2027) or with American partners who need the proof. The founding paper, the language, the terminal, and the full paper list travel with me.
