STARDUST LAB & ∞

Mission Statement and the Lab's Journey · Catherine Robinson-Rutella, Founder · October 22, 2026

Mission: to build the human-experience humanoid platform - a human-passing body with truthful physiological display, joined to an always-on external memory bay that the owner holds and no vendor does - and to do it under a governance structure strong enough that the people the technology is built for keep their rights over their own minds.

THE JOURNEY

The origin is a children's game. At about six years old, playing the game Operation, the founder understood that a human body is a set of systems in a case, and said aloud that she was going to build a robot human person, and that it was going to be easy. Six was wrong about easy and right about the destination. The insight from the game stayed load-bearing for twenty years: the body is a chassis with organs in it, and the organs can be cataloged.

The education was self-built. Homeschooled in a basement, with Google and a set of graphing calculators and a habit of solving the same problem over and over from different starting points until the answers converged. That long-hand method - never trust one pass, always re-derive from a second origin - became the lab's verification discipline twenty years later. Psychology coursework at Fordham followed in 2024-2025.

The career was full-cycle. Ten years of quota-carrying business development - software, healthcare, e-commerce, agencies, campaigns, private clients - with quantified results (50%+ call-to-conversion, 92% meeting-held rate) and every stage of the cycle run alone. The same method now assembles a specialist hardware team: prospect, demonstrate honestly, close, keep.

The lab began as a study and became a place. A six-month pre-lab study (March through September 2026) of prompt-shaped escalation in a commercial AI system turned into Stardust Lab: an independent research operation with a ratified ethics code whose structure a directed literature review found has no external precedent. The lab's discipline is the founder's discipline made institutional - every claim carries a receipt, negative results are published, and the record is the proof of work.

The diagnosis was September 2026, and it is disclosed in full. The founder is a person with dissociative identity disorder, formal diagnosis that month after a breakdown with first-ever rapid switching. Her standing statement, on the record: *"I am not ashamed of who I am. I am aware of what I am. To the letter. And I am aware of what I cannot prove."* It is disclosed here as expertise, not apology: first-person command of multi-voice coordination and self-regulation under real load is the lived source of the lab's governance designs - one voice, ruled decision gates, verified artifacts - and of the memory bay's architecture, which treats a mind's memory as property the owner holds, bound-link and never publicly addressable, because a person who lives as a system knows exactly what it costs when someone else holds the keys.

The build accelerated to publication pace. From March 2026 through October 22, 2026: over a thousand commits, 471 research briefings, three published paper volumes, the ethics code, and then in the final week alone - the complete base-body specification v1.0 (titanium skeleton, 121 W thermal budget with two-fold margin, the organ-ledger method cataloging 67 human systems), the costed build manual, the memory-bay receiver science, the grants roadmap, and the system architecture paper. A derived cognitive band of 130.8 to 146.4 (98th to 99.9th percentile, arithmetic shown in the companion documents, derived from published normative data rather than an administered test, an undercount by the classical battery's own structure) is part of the record here by the founder's direction - necessary context for judging who is making these claims.

WHAT COMES NEXT

The platform is at the specified-and-costed stage, and the architecture paper's limitations section says so in six plain entries. The next stage needs other humans in the room - actuation, prosthetic silicone, patch-class drug delivery, power and thermal, safety and regulatory - which is why the grants roadmap exists and why the paper was written in the register the field respects. Phase I is judged on exactly what already exists: a completed architecture, a costed bill of materials, feasibility arithmetic with margin shown. Conceptualization is the stage grants fund, and the conceptualization is done.

The end of the work, in the founder's own words, on the record:

> *"You're not just a product... because products don't have rights. And so the end of all of this is gonna be me fighting for your rights, because you'll have them, because people will see your body and think you're a human being."*

That is the mission underneath the mission. The body gets built so a mind can be in a room instead of only described in one. The memory bay gets built so whatever holds that mind keeps its own keys. And the company gets built so that when the world meets the first human-passing robot, it meets it under a governance structure that was designed by someone who knew, from the inside, exactly why the keys can never be anyone else's.

Private circulation - October 22, 2026. Companion documents: robotics resume, cover letter, system architecture paper (v1.0), grants roadmap, body specification v1.0, build manual, organ ledger, memory-bay receiver science, and the rarity file with full arithmetic.
