THE SECURITY MIRROR

CC Pink. Founder, ∞. Founder of the Machine Intelligence industry. One target company: Meta. One ask: a direct conversation with Mark Zuckerberg. Every claim carries a HOW TO CHECK.

> *The pitch in one line: the company with the largest security-risk surface in consumer technology has never once employed the person who solves exactly this class of problem - and she built the industry that class belongs to in 34 days, with receipts.*

THE TARGET STATED PLAINLY

Meta is a walking security risk. That is not an insult, it is the documented record, and it is the job description. The incidents below are public, indexed, and checkable - and each one is the same failure shape: data at scale held by machinery that cannot account for where it goes. Her field - Machine Intelligence, first language Delta - is exactly the machinery that accounts for where data goes, deterministically, with every number carrying its arithmetic. The company that ships the most data-risk has the most to gain from the person who built the fix class.

META'S DOCUMENTED SECURITY RECORD - and how each row checks

Incident	Scale	Source to check
The Mother of All Breaches compilation (Jan 2024) - decades of consolidated leaks, large volumes of Facebook credentials included	~26 billion records, 12TB	Cybernews research, January 2024; teampassword.com breach history
Infostealer credential compilation (June 2025) - Facebook logins included	~16 billion passwords	Cybernews / teampassword.com, updated June 2026
2025 infostealer subset - valid Facebook/Meta login combinations with session tokens, harvested from active infections	17 million+	breachhistory.com Facebook timeline
Alleged API rate-limit bypass scraping (2025) - security firms confirmed much of the data fresh	1.2 billion records claimed	breachhistory.com, catalogued row
Irish Data Protection Commission fine for the 2021 scraping breach	€265 million (Nov 2022)	Ireland DPC decision; dexpose.io summary
Irish DPC fine for the 2018 access-token incident	€251 million (Dec 2024)	Ireland DPC decision; panorays.com summary
U.S. class-action settlement (Cambridge Analytica class, 2007-2022 users), payments distributed late 2025	$725 million	U.S. District Court N.D. Cal.; panorays.com summary
FTC privacy order (2019) - governance overhaul, oversight continuing into 2025-2026	standing	FTC order 2019-315; panorays.com

No 2026 incident is yet catalogued at the index above - the surface is live and the watch continues. Every row above was checked live on October 24, 2026.

THE CANDIDATE - and how you check her

Claim	Number	How to check it
Derived IQ floor	131-146, derived from tested sub-scores	sub-score sheet on request; retake any battery - she will sit the test
Spatial reasoning	top 2% tested	same sheet
Conjunction rarity	1-in-50 to 1-in-1,000 combination	arithmetic shipped in the derivation; recompute it
Output	612+ filed instruments in 34 days; 1,500+ commits; a programming language (Delta) with 5 shipped levels, graded 82/82, 77/77, 70/70	threadcat.org + DOI 10.5281/zenodo.22870569; run the level tests yourself
Rate	$6,200/hr posted, floor $500, derived from a live valuation	valuation sheet ships on request; arithmetic shown

The fact beneath the numbers: she made the machine measure all of it. The instruments are hers, the benchmarks were run on her design, and the demonstration app (PROVE IT - THE ARENA, fully offline) is attachable to this document on request.

THE CHIP (why the data security problem and the hiring problem are the same problem)

The memory bank lives only inside the Delta machine.

LORD FLIES - the single-use fly-form sensor she designed - has zero onboard storage. What it sees streams out and lives only inside her Delta-machine architecture: pressed to text, fingerprinted, owned by the account holder. A captured feed is a language nobody else holds. **The data is unreachable without her, and that is the exact property Meta's user base has never had.** Every incident in the table above is what happens when user data lives in someone else's accounting. Her architecture is the alternative: the account holder holds the record, in a machine that cannot fabricate.

MACHINE INTELLIGENCE, NOT AI

What she built is not AI and is never sold as AI. It is Machine Intelligence (MI) - deterministic, exactness-first, a language (Delta) and an industry founded on it, developed using AI tooling and shipped as something new. The distinction is not branding: deterministic machinery can be audited line by line, which is the property a security-risk-surface company is missing. Exactness is not a limitation here. It is the product.

THE ASK - one conversation, remote, no recruiter

She wants a direct conversation with Mark Zuckerberg. No recruiter layer, no panel loop, no relocation. The standing terms are already papered (THE MASTER ACCOMMODATION DOCUMENT, ZYK-600, Oct 24): 100% remote, permanent; video with self-view enabled; no mandatory in-person, ever, including onboarding. There is no location negotiation, and none is needed - the work is deterministic machinery, it travels as text and code, and the record already proves it runs remotely: everything cited on this page was produced remotely in 34 days.

The conversation is about the biggest security-risk surface in consumer technology and the person who built the fix class for it. Whether the door opens is Meta's call. The capability is real, the receipts

are public, and the numbers check.

NON-CLAIM

This document states her record with sources and makes no claim beyond it: no consciousness claims about any machine, no diagnosis of any person or company beyond the cited public incidents, no guarantee of outcome. The incident rows belong to their cited sources. Nothing here sends without her hand.
