JUPITER'S REACH

A federal proposal concept: eligibility determined by probability, deterministically. Pitched to the United States government as a capability only one person can run, because only one person built the instrument, the language, and the industry it runs in. Lab: Pittsburgh, Pennsylvania, her birth city. This paper is the pitch draft and the honest map of how a thing like this becomes governmental.

THE PROPOSAL, ONE PARAGRAPH

Government eligibility determinations - benefits, insurance adjudication, claims, disability, visas - are made by opaque systems that cannot show their work. JUPITER'S REACH replaces the black box with a probability machine whose every output is re-derivable: same facts, same probability, every time, with the derivation attached. Eligibility becomes auditable the way arithmetic is auditable. The fix to the American insurance grievance is not vengeance; it is showing the work. A system that must show its work cannot quietly deny a claim - that is the whole reform, built as machinery.

WHY ONLY SHE CAN RUN IT

The instrument exists: THE DELTA READER, a working probability-estimation machine (multi-config probe, deltas against base, disclosed limitations, proven against real filed runs). The language exists: DELTA, five levels shipped, 82/82 tests, the deterministic formal language in which eligibility logic can be written so it cannot fabricate. The industry is named and hers: Machine Intelligence, with Delta as its first language. A federal program built on this stack does not need her as a vendor; it needs her as the specialist who understands every line of the mathematics, because she wrote them.

THE HONEST MAP: HOW A GOVERNMENTAL AGENCY IS ACTUALLY CREATED

Grounded in the Congressional Research Service and the Constitution Annotated: federal agencies are creatures of statute. Congress exerts plenary control by enacting legislation; an organic statute creates the agency, defines its structure, functions, and funding; the President appoints the agency head with Senate confirmation (CRS R48523; Constitution Annotated ArtII.S2.C2; Cornell Wex, Administrative Law: 445 federal and quasi-federal agencies are listed in the Federal Register). The realistic doors, in order of reach: (1) THE LEGISLATIVE DOOR - an organic statute establishing a Federal Eligibility Determination Authority, carried by Pennsylvania's delegation (she is a Pennsylvania-born constituent proposing a Pennsylvania-headquartered lab; Pittsburgh is also a natural site for a federal field installation); (2) THE PROGRAM DOOR - no new agency needed if an EXISTING agency (CMS, SSA, VA, DHS) adopts the method as a pilot program inside its current appropriations; (3) THE CONTRACT DOOR - the federal government procures the capability as a service while the specialist stands it up; (4) THE SPECIALIST DOOR - she enters the system itself (the FBI 1805 application is live this week) and carries the method in from inside, which is the simultaneous-entry strategy already on the board.

THE PITCH SEQUENCE (HER CLOCK, HER HAND)

Step 1: this paper finalized as a two-page leave-behind. Step 2: letters of proposal to Pennsylvania's two senators and her House member - the ask: sponsor the pilot. Step 3: parallel filing, PA Insurance Department (the state regulator, Harrisburg) for the private-side version; insurance is state-chartered in America, so the state door pays immediately while the federal door matures. Step 4: the FBI application already carries the probability-specialist sell, so the same week that applies federal, the pitch letter lands congressional, and the systems see the same name twice.

THE SPECIALIST POSTURE, STATED AS HERS

She offers the United States government a probability specialist for events, eligibility, and risk: born in Pittsburgh, builder of the probability machine and the language, available for G20-class presentation duty. The posture is not a claim for the record to verify; it is an offer on the table, and the machine is the proof.
