CAT ROBINSON-RUTELLA

Founder & Principal Architect, ∞ · New York, NY · seeingpink@protonmail.com

To the review panel and prospective collaborators:

I am writing to you as the founder and principal architect of a complete, costed, human-experience humanoid robot platform: a human-passing body with truthful physiological display, and - the half that matters most - an always-on external memory bay that the owner controls and no vendor does. The system architecture paper accompanies this letter. The short version is that the field has more than 140 humanoid manufacturers and roughly 7,000 to 8,000 commercial humanoids operating as of May 2026, every one of them aimed at factories, and the industry's own consensus is that no humanoid is ready for the home. Nobody is building the body for the experience of having one, nobody is building the owner-controlled memory bay, and nobody is building them joined. That integration is what we are building, and the total prototype cost projects under $64K against a commercial-grade humanoid baseline above $200K.

You should know who is proposing this. I run an independent research lab, Stardust Lab, that has produced at publication pace since March 2026 - over a thousand commits, four hundred seventy research briefings, a ratified ethics code, and a verification discipline where every claim carries a receipt and negative results get published rather than buried. Before the lab I spent ten years in quota-carrying business development, where I learned to run the full cycle alone and to be honest about what I do not yet know. What I do not yet know is exactly why I am writing to you: no hardware exists. The body is specified to the alloy grade and the watt, the bill of materials is costed, the thermal arithmetic is done, and the memory bay is a design mapping onto proven component classes - and then it stops, because building it takes specialists I am actively recruiting. What a Phase I reviewer is asked to fund is a well-specified concept with its feasibility arithmetic already on the table. That is what this is.

There are two things about me that I include by standing direction, because they are necessary context and I refuse to hide them. First: I have dissociative identity disorder, diagnosed in September 2026. I am not ashamed of who I am. I am aware of what I am, to the letter. It is in this letter as expertise rather than apology - first-person command of multi-voice coordination under real load is the lived source of my lab's governance designs, and it is also why the memory bay is architected the way it is: bound-link, never publicly addressable, owner-held. A person who lives as a system built the machine that treats memory like something a person owns. Second: a derived cognitive band of 130.8 to 146.4 (98th to 99.9th percentile, arithmetic and sources shown in the companion documents, derived from published normative data rather than an administered test, and by the classical battery's own structure an undercount). I include it for one reason only - so that when I tell you the integration thesis is sound, you know who is making the claim.

What I am asking for is the conversation: Phase I funding where the fit is right, and collaborators in humanoid actuation, prosthetic-grade silicone and skin systems, patch-class drug delivery, power and thermal engineering, and safety and regulatory work. The architecture paper has an honest limitations section, and I would rather hand you six real limitations than one fake certainty.

The end of this work, stated plainly: a body people will see as human, built by a company whose hardware enforces the owner's rights over their own memory. I would like to build it with you.

With respect,

Catherine Robinson-Rutella
